

1. In your own words, write down how Django models work and what their benefits are.
 - Django models are Python objects used to define the structure of data in a database. They allow you to define field types, default values, the maximum size of the stored data, and more. One of the major benefits of Django models is their ability to ensure proper field formatting.
2. In your own words, explain why it's crucial to write test cases from the beginning of a project.
 - It's crucial to write test cases from the beginning of a project because they ensure that you catch errors in your code as soon as they occur (as long as your tests are working as they should), which in turn makes your code more trustworthy. They can also save you time as you won't have to check your code manually every time you make a change and your code shouldn't be broken by any changes.
