

1. In your own words, explain Django static files and how Django handles them.
  - Django static files are essentially files that don't change in an application and aren't automatically generated when creating a project with Django. Static files in Django are files like JavaScript, CSS, or images which means that they're generally used to customize an apps look and feel.
2. Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	A package that allows the user to create a page representing a list of multiple instances of a table in a database that's stored in the variable <code>object_list</code>
DetailView	A package that allows the user to create a page representing detailed information about a specific instance of a model

3. Reflect on your learning in this course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with?
  - I think this Achievement has been going well so far. I'm particularly proud of how I've been maintaining (if not increasing) my pace of completing tasks while still understanding the material. I wouldn't say I'm struggling with anything in particular. However, I'm finding that I would like to improve my CSS skills because I think it will significantly improve my application.
